

```
#flights |>
  #select(tailnum) |>
  #arrange(arr_delay)
#> Error in `arrange()`:
#>   In argument: `..1 = arr_delay`.
#> Caused by error:
#> ! object 'arr_delay' not found
```

This code doesn't work because `select` drops all of the other columns except `tailnum` so then when we go to `arrange(arr_delay)`, it no longer exists because we have already filtered out all of the columns except `tailnum` and there is no longer a variable to pick out called `arr_delay` in this code chunk.

I have commented out that last code chunk because R will not render my document with it.
